

Geometric and Graphics Programming Laboratory: workshop 1

Alberto Paoluzzi

October 23, 2017

Outline: workshop 1

- 1 From PLaSM classic to Pyplasm
- 2 Jupyter notebook required
- 3 Minimal git/github instructions

From PLaSM classic to Pyplasm

Syntactical diffs (1/2)

PLaSM classic

- List

$\langle a, b, c, d \rangle$

- Application operator

$\text{fun} : \text{args}$

- Composition operator

$f \sim g$

- Construction operator

$[f, g, h] : x == \langle f : x, g : x, h : x \rangle$

pyplasm (Python)

- List (array)

$[a, b, c, d]$

- Application operator

$\text{fun}(\text{args})$

- Composition operator

$\text{COMP}([f, g])$

- Construction operator

$\text{CONS}([f, g, h])(x) ==$
 $[f(x), g(x), h(x)]$

Syntactical diffs (2/2)

PLaSM classic (FL)

```
DEF name (arg::pred)(a1,a2::pred) = expr
WHERE
    local1 = expr1,
    local2 = expr2
END
```

pyplasm (Python)

```
def name(arg):
    def name1(a1,a2):
        return expr
    return name1
```

Workshop assignment

Convert some Classic PIASM scripts from Chapter 1 and/or Chapter 2 of book [Geometric Programming for Computer-Aided Design](#) (GP4CAD)

Free choice of number and type of scripts to Convert

Style specs (1/2)

- produce a **notebook** file, of type `.ipynb` (The ipynb file extension is associated with the **IPython notebook** and/or **Jupyter**, a rich architecture for interactive computing written in Python and available for various platforms.)
- alternate notebook cells with
 - Title and description (markdown)
 - PLaSM classic code (markdown teletype)
 - Python code
 - Image from execution (markdown)

Style specs (1/2)

- standard output: a single **HPC** value
- use **meaningfull identifiers** (variables and parameters)
- use **camelCase** ids
- add **Python docstrings** (google for it)
- produce a **single** notebook file, named **workshop_01.ipynb**
- file path: **your_repos/ggpl/2017-10-23/workshop_01.ipynb**

Jupyter notebook required

Notebook tutorial

Notebook Basics

Minimal git/github instructions

Minimal git/github instructions (1/2)

create your local repository

```
$ mkdir development
$ cd development
$ git clone https://github.com/your-account/ggpl
$ cd ggpl
$ mkdir 2017-10-23
$ cd 2017-10-23
$ touch workshop_01.ipynb
```

Minimal git/github instructions (2/2)

commit your work

```
$ git add -A .
```

```
$ git commit -m "add a short note to commit"
```

```
$ git push origin master
```
